

ABSTRACT OF THE DISCLOSURE

5 A kit for a securable enclosure having a front opening. The kit is placeable selectively in an assembled state and a disassembled state. The kit includes a top panel, first and second side panels, a rear panel, and first and second connector parts. The top panel, first and second panels, and rear panel are connected to each other to bound a storage space accessible through the front opening. The first connector part is fixedly attached to one of the top panel, first side panel, second side panel, and rear panel. The second connector part is fixedly attached to another one of the top panel, first side panel, second side panel, and rear panel. The first and second connector parts are connectable, each to the other, without any additional separate parts, to maintain the one and the another of the top panel, first side panel, second side panel, and rear panel, together with the kit in the assembled state.
